

Windows 10 uses **YOUR** Internet Connection to upload updates to other computers on the Internet

Windows 10 has a “peer-to-peer” download feature for Windows updates and Windows Store apps. By default, Windows will automatically use YOUR PC’s Internet connection to upload updates that you have already downloaded to other PCs anywhere in the world. Microsoft is using YOUR precious internet megabytes without your knowledge, to reduce the load on Microsoft servers!

How does this work?

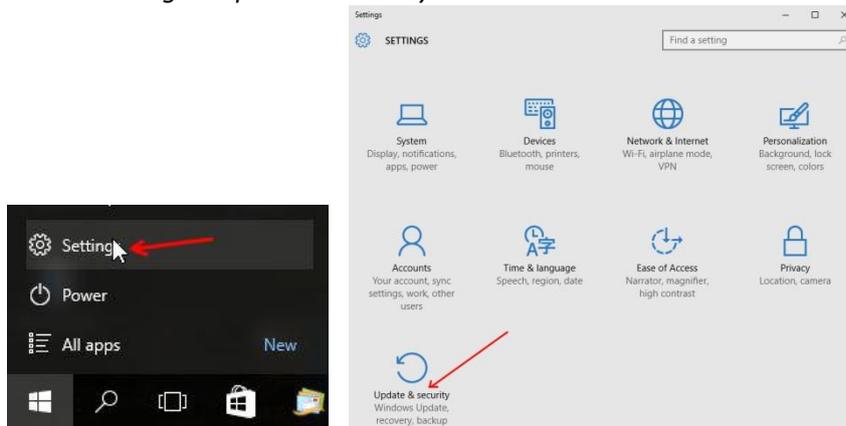

When your computer checks for updates to Windows, Office or apps, it may download them from Microsoft servers, or someone else’s PC who has already downloaded them. This doesn’t impact on your Internet usage or speed because one way or the other, you have to download the updates. But it does take the pressure of Microsoft servers because other people’s PCs are being used.

Where it **DOES** affect you is if you have already downloaded an update, and Microsoft happens to choose your computer to upload the update to another PC somewhere. Say the update was 10MB—that would use 10MB of your Internet upload megabytes AND, for the duration of the upload, cause your internet to slow down. *This happens without your approval or knowledge!*

This setting may be reset after a Windows upgrade so it should be checked occasionally.

You can turn this off as follows:

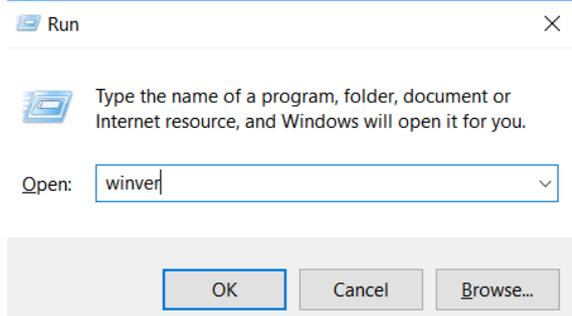

Start > Settings > Update & security

What you do next depends on which version of Windows 10 you have. To see your version:

Hold the Windows key down and tap the letter R

In the Run box that appears type winver, click OK

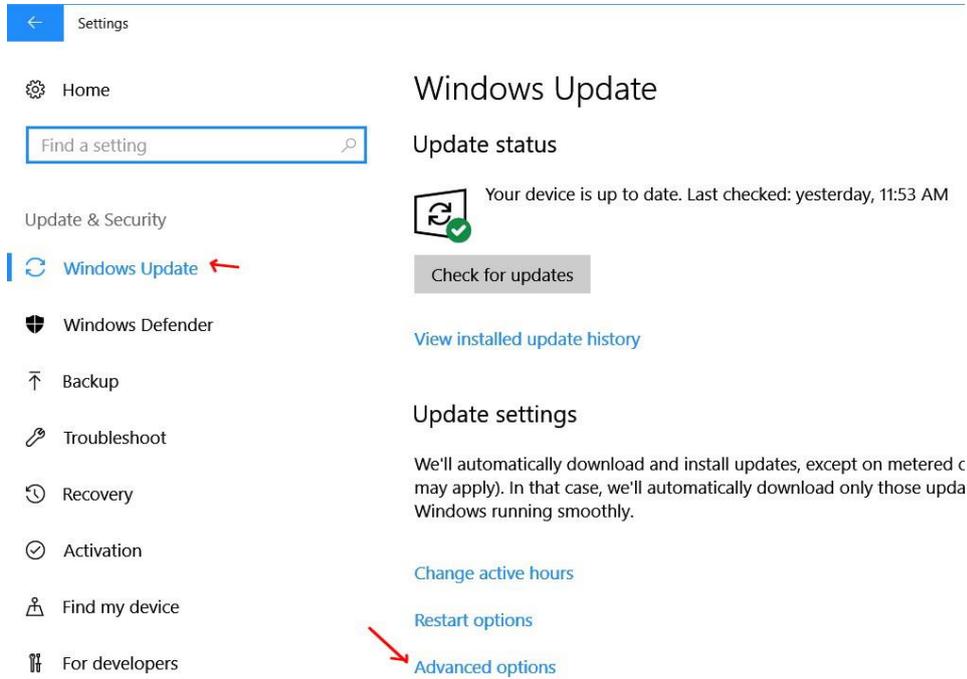

The version number will be displayed, in this case it is 1709

If you have the September 2017 Fall Creators Update (version 1709) or later, go to the next page. If you have an earlier version of Windows 10, go to the section *Windows 10 version 1703 or earlier*.

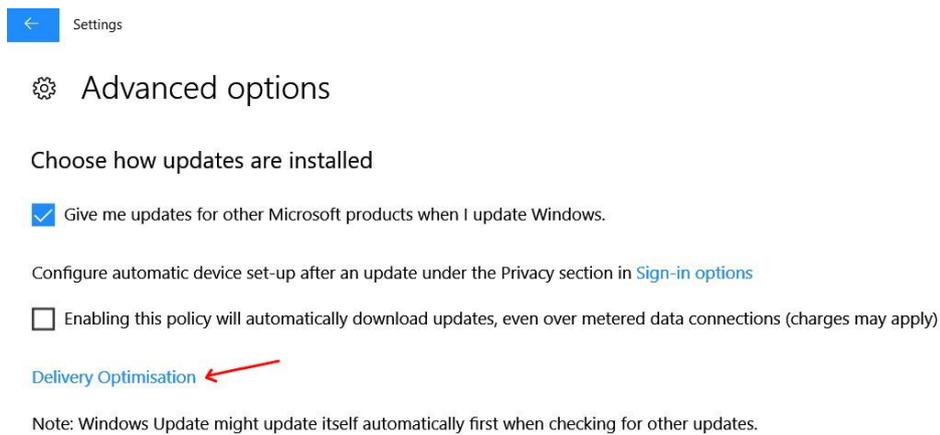

Windows 10 version 1709 or later

In Windows Update, click *Advanced options*

The screenshot shows the Windows Settings application. The left sidebar is open to 'Update & Security', with 'Windows Update' selected. The main pane displays the 'Windows Update' page. Under 'Update status', it says 'Your device is up to date. Last checked: yesterday, 11:53 AM' with a green checkmark icon. Below this is a 'Check for updates' button and a link for 'View installed update history'. Under 'Update settings', there is a paragraph of text and three links: 'Change active hours', 'Restart options', and 'Advanced options'. A red arrow points to the 'Advanced options' link.

Click *Delivery optimisation*

The screenshot shows the 'Advanced options' page in Windows Settings. The title is 'Advanced options'. Below it is the heading 'Choose how updates are installed'. There are two checkboxes: the first is checked and labeled 'Give me updates for other Microsoft products when I update Windows.'; the second is unchecked and labeled 'Enabling this policy will automatically download updates, even over metered data connections (charges may apply)'. Below the checkboxes is a link for 'Delivery Optimisation' with a red arrow pointing to it. At the bottom, there is a note: 'Note: Windows Update might update itself automatically first when checking for other updates.'

In the section *Allow downloads from other PCs*, either turn it *Off* or, if you have other Windows 10 PCs connected to the same modem, leave it *On* and select *PCs on my local network*

Delivery Optimisation

Windows Update Delivery Optimisation provides you with Windows and Store app updates and other Microsoft products quickly and reliably.

Allow downloads from other PCs

If you have an unreliable Internet connection or are updating multiple devices, allowing downloads from other PCs can help to speed up the process.

If you turn this on, your PC may send parts of previously downloaded Windows updates and apps to PCs on your local network or on the Internet. Your PC won't upload content to other PCs on the Internet when you're on a metered network.

[Choose how updates are delivered](#)

In *Updates from more than one place*, your settings will probably look like this.

Turn it *Off* - this disables the peer-to-peer update feature entirely. Updates will only be downloaded from Microsoft's servers, and won't be uploaded to anywhere.

Updates from more than one place

Download Windows updates and apps from other PCs in addition to Microsoft. This can help speed up app and update downloads. [Learn more](#)

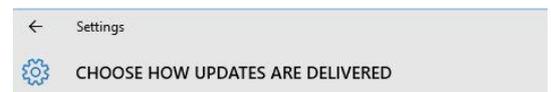

When this is turned on, your PC may also send parts of previously downloaded Windows updates and apps to PCs on your local network, or PCs on the Internet, depending on what's selected below.

Off

Get updates from Microsoft, and get updates from and send updates to
