

# Cleaning your Internet browser cache

In your internet browser, you should periodically clear the temporary internet files or cache, which can use a lot of space and slow down your browser when full, and some web sites may stop working correctly. If you are having problems with your browser, try cleaning the cache. If that does not resolve it then you can **Reset your browser** (see separate document). Following are instructions on how to clean up the four major browsers:

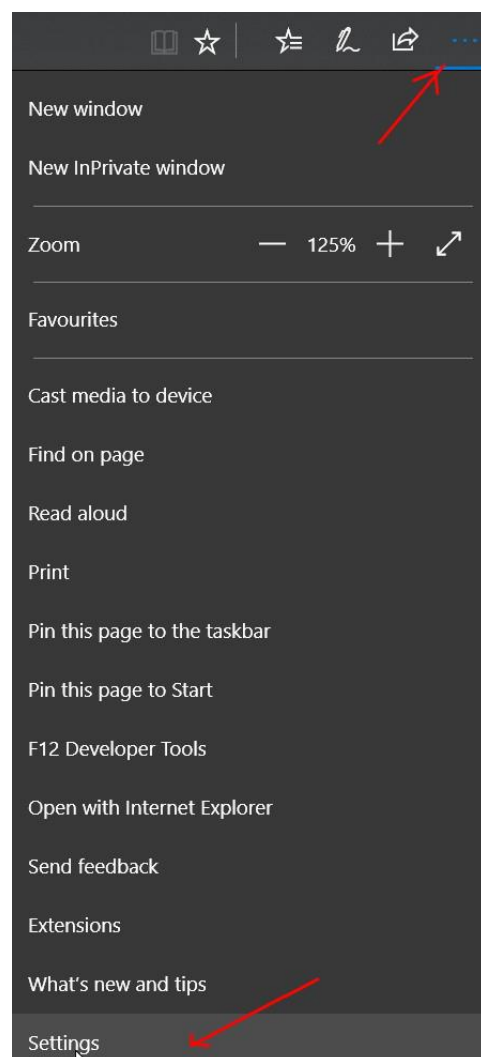

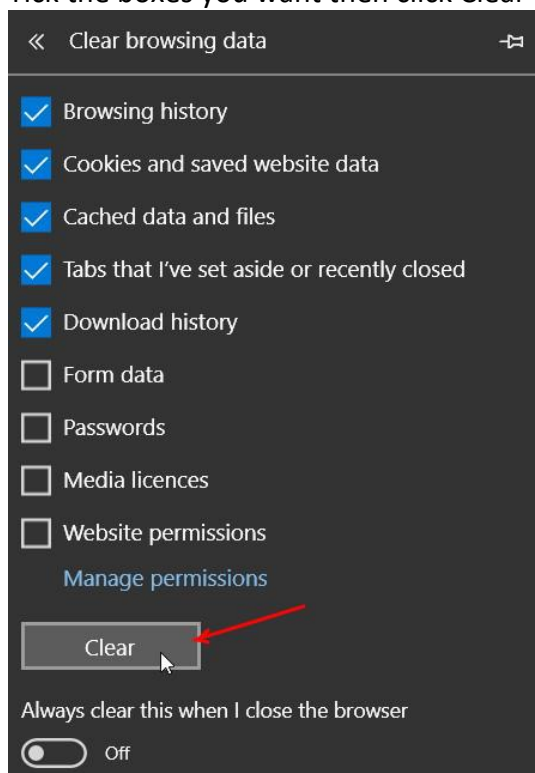

## Clean Microsoft Edge Browser

Start Microsoft Edge, click on the Options menu and click on *Settings*

In the *Settings* window under *Clear browsing data*, click *Choose what to clear*

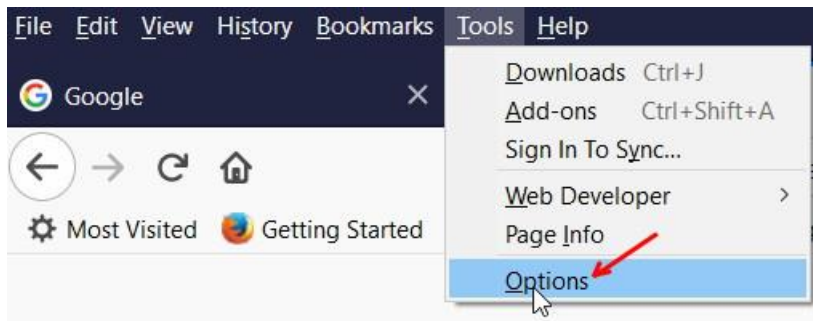

Tick the boxes you want then click Clear

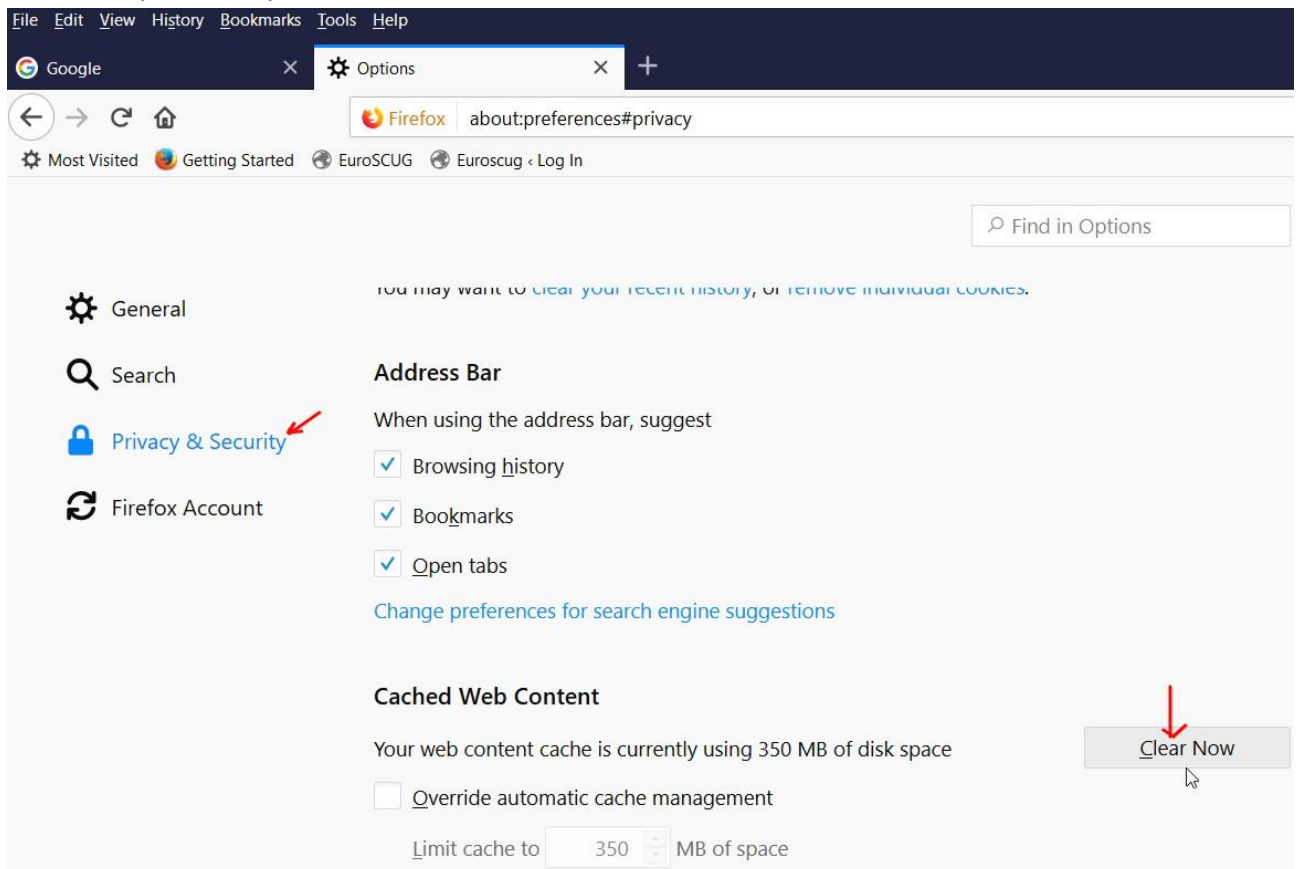

## Clean Firefox Browser

Start Firefox. If you don't see the main menu (File, Edit, View etc), press the Alt button on your keyboard,

Click *Tools* then *Options*

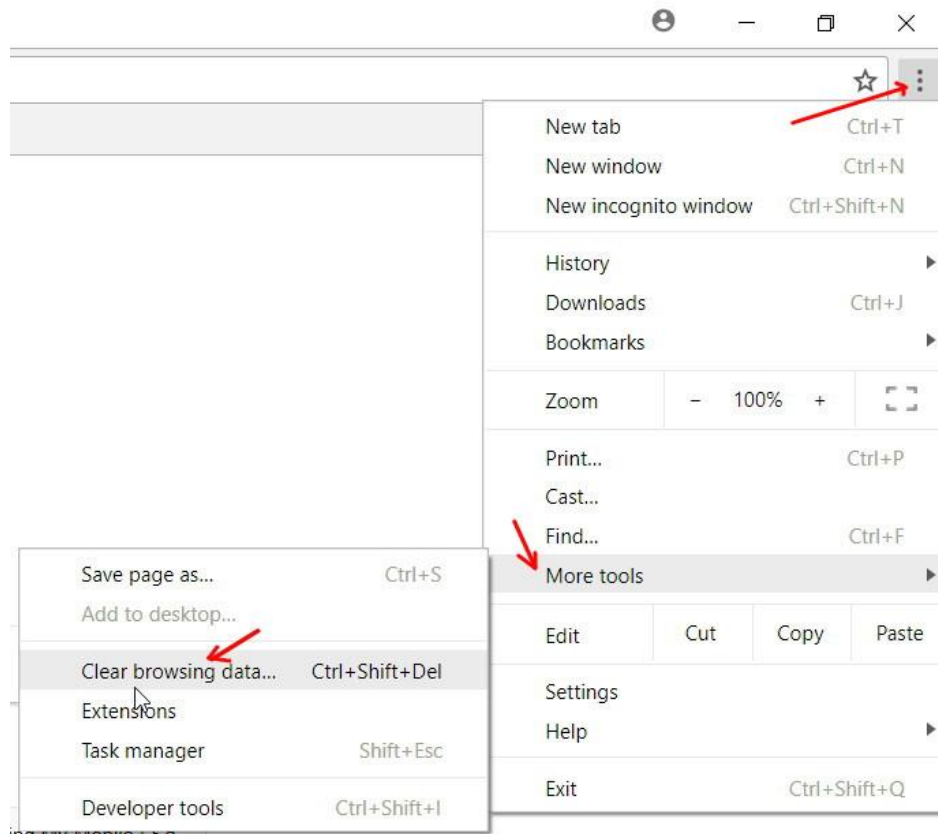

Click *Privacy & Security*, under *Cached web content*, click *Clear Now*

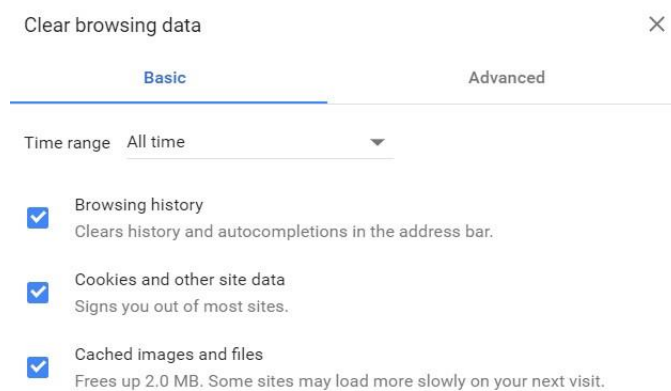

# Clean Google Chrome Browser

Start Chrome, click on the Options menu (three dots upper right), then *More tools*, then *Clear browsing data*

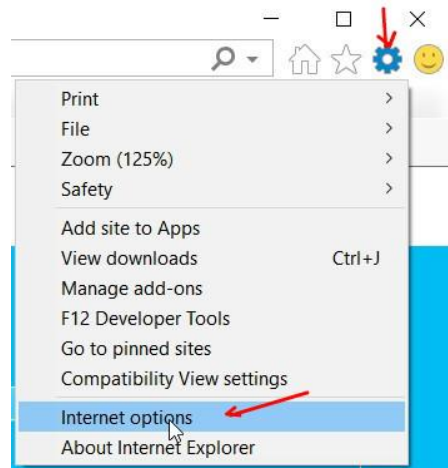

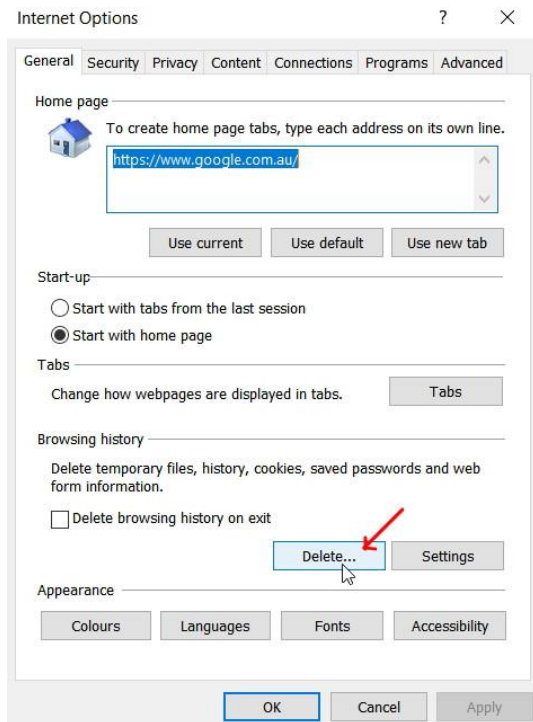

Then tick the boxes you want and click *Clear data*

# Clean Internet Explorer Browser

Start Internet Explorer, click on the Options button (cog wheel upper right), click *Internet options*

Under *Browsing history*, click *Delete*

Tick the boxes you want then click *Delete*
